

## Injazat's Managed Services Portfolio

## Injazat's Managed Services Portfolio

# Overview

Premium Managed Services to Transform Your IT Environment

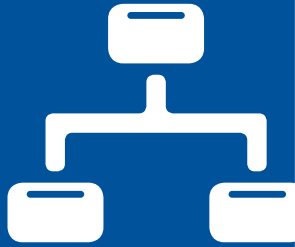

Injazat's Premier Tier IV Data Center is built to offer the highest level of security and reliability. Along with our proven Managed Services Suite, Injazat can help your organization to effectively manage its valuable IT assets.

Injazat's strong local presence and knowledge, combined with HP's global capability and strength, offer you world-class IT services.

Injazat Managed Services provide innovative cutting-edge technologies to ensure maximum uptime for your business operations. No matter how complex your technology needs, we have the expertise and support that no other managed services provider can offer.

# Managed Services Portfolio

## Managed Network Services

Injazat Managed Network Services optimize the performance and availability of the network and help manage the growing complexities of aligning your communications and network needs with your overall IT strategy.

-  Managed LAN Services
-  Managed Router Services
-  Managed Remote Access Services
-  Managed Server Load Balancing Services

## Managed Security Services

Injazat Managed Security Services keep you ahead of the constantly changing threat landscape by utilizing leading-edge technologies and industry skilled resources to design, deploy, configure and manage secure and compliant solutions.

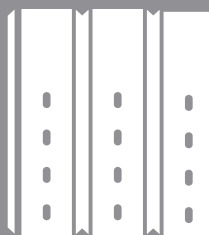

-  Managed Firewall Services
-  Managed Intrusion Prevention & Detection Services
-  Managed Distributed Denial of Service Prevention Services
-  Managed Security Information Event Management Services

## Managed Storage, Backup & Restore Services

Injazat Managed Storage, Backup & Restore Services enable you to optimize and manage information throughout its lifecycle, maintaining the right level of storage for information from the time it is created until it is deleted.

-  Managed Storage Services
-  Managed Backup & Restore Services

## Managed Data Center Services

Injazat Managed Data Center Services help transform your business through hosting, server consolidation, virtualization, business continuity and application hosting.

-  Managed End Point Data Protection Services
-  Managed End Point Threat Management Services
-  Managed Virtual Server Services

# Managed Network Services

Injazat Managed Network Services optimize the performance and availability of the network and help manage the growing complexities of aligning your communications and network needs with your overall IT strategy.

## Managed LAN Services

**Connect, Fast**

Leave the technical complexities of LAN design and ongoing management to Injazat's experts, who engineer, install, configure and proactively monitor our clients' network environments. Injazat's Managed LAN Services offer a scalable solution to meet the constantly changing needs of growing businesses and the increasing demands of today's data, voice and video applications.

## Managed Router Services

**Integrated Connectivity**

Managed Router Services connect our clients' enterprise sites to their Local Area Networks residing in the Injazat Premier Data Center for fast, intelligent routing of your network traffic with MPLS technology. Leverage a resilient architecture and eliminate the complexity of managing disparate networks.

## Managed Remote Access Services

**Enterprise Access from Anywhere**

Securely access and control your servers and network equipment residing in our Premier Data Center from any remote location with an internet connection, for convenience and increased productivity. Managed Remote Access Services prevent security breaches by combining data encryption, user authentication, Secure Sockets Layer, IP Security and Virtual Private Network technologies.

## Managed Server Load Balancing Services

**Offload Server Workload**

Managed Server Load Balancing Services distribute network traffic among mirrored servers co-located within the Injazat Premier Data Center by providing a greater redundancy for services hosted on those servers. The main benefit is to provide high-availability and scalability to hosted applications such as websites. The services are also able to monitor the health of the applications running on those servers and process all SSL traffic to improve the server performance by offloading processor intensive tasks.

# Managed Security Services

Injazat Managed Security Services keep you ahead of the constantly changing threat landscape by utilizing leading-edge technologies and industry skilled resources to design, deploy, configure and manage secure and compliant solutions.

## Managed Firewall Services

**Guard Against Unauthorized Access**

Managed Firewall Services offer an integrated system of hardware and software that controls access to your network and defends it with a secure perimeter. The services offer application-level segregation of network traffic with on-going monitoring and management. In addition, the services offer redundant Firewalls for 24/7 protection while load-balancing maintains network responsiveness.

## Managed Intrusion Prevention & Detection Services

**Around-the-Clock Network Surveillance**

Managed Intrusion Prevention & Detection Services mitigate a wide range of malicious attacks to protect your network and sensitive data. The services offer continuous proactive monitoring with real-time traffic analysis while constantly updating threat signatures. In addition to offering end-to-end implementation and management, the services offer customized filtering policies.

## Managed Distributed Denial of Service Prevention Services

**Guard-and-Detect**

Managed Distributed Denial of Service Prevention Services employ a 'guard-and-detection' mechanism that blocks attack traffic. The DDoS prevention service performs attack analysis, identification and subsequent mitigation mechanisms in real-time by filtering and monitoring traffic to identify characteristics and generate alerts for evolving attack patterns, ensuring the highest possible level of up-time for your critical Internet-facing services.

## Managed Security Information Event Management Services

**Proactive Security Monitoring and Intelligence**

Managed Security Information Event Management Services offer organizations with near 'real-time' security analysis of logs and events from a variety of infrastructure nodes and deliver the highest level of network security, refined threat detection and compliance reporting. The services collect all security relevant system log data into a centralized repository and correlates all the events in order to identify common attack patterns and incident root causes. The services also provide many compliance reports such as SOX, PCI, HIPAA, and ISO 27001, which would otherwise require considerable effort to collect and aggregate.

# Managed Storage, Backup & Restore Services

Injazat Managed Storage, Backup & Restore Services enable you to optimize and manage information throughout its lifecycle, maintaining the right level of storage for information from the time it is created until it is deleted. Injazat supports Enterprise and Departmental Storage, Data Archiving and Disaster Recovery & Business Continuity through various services.

## Managed Storage Services

**Data is the Lifeblood of Your Business**

With the exponential growth of data-intensive applications and the increasing demand for performance, security and availability, data storage is critical to your business. At the same time, budget constraints require you to do more with less. Injazat provides an enterprise-wide approach to managing, protecting, storing and retrieving your data in dynamically changing business conditions, so you can leave the technical worries to us.

**A Broad Range of Storage Tiers**

Injazat offers Managed Storage as a pay-per-use service, to store data with a range of performance tiers closely aligned to your business needs. Optimize your data placement and balance cost with performance to meet your Information Lifecycle Management strategy.

- Storage Area Network architecture is designed with a high-speed Fibre Channel to support applications requiring fast retrieval, redundancy and load-balanced access.
- Network Attached Storage architecture supports traditional data storage and retrieval over TCP/IP networks more economically.

## Managed Backup & Restore Services

**Bring Certainty to Disaster Recovery**

Managed Backup & Restore Services provide cost-effective protection for your critical business data, using modern disk-based or traditional tape-based solutions. Injazat can custom tailor a backup strategy to ensure that your business operations remain uninterrupted. Injazat's Managed Backup & Restore Services let you leverage our fully automated backup capabilities, meet your recovery point objective and achieve a lower recovery time objective.

# Managed Data Center Services

Injazat Managed Data Center Services help transform your business through hosting, server consolidation, virtualization, business continuity and application hosting.

## Managed End Point Data Protection Services

**Data Loss Prevention with PC Backup**

Managed End Point Data Protection Services offer a fast, automatic and transparent solution for backing up corporate data residing in desktops, laptops and servers into a secure remote location with self-service restore capabilities. Re-evaluate your Storage Strategy, deactivate home-shares and set minimal storage quotas by introducing the use of local Email archive files. The services can also be used as a data migration tool to quickly restore user's data when replacing the hardware or upgrading the OS image.

## Managed End Point Threat Management Services

**End Point Security**

Managed End Point Threat Management Services secure desktops, laptops and servers against viruses, malware, spyware and unauthorized access to end points. The services incorporate design, implementation and management of end points devices and addresses the security need by offering a complete range of protection features managed by a single management platform. The services constitute cleaning or containing virus infections and outbreaks, quarantining or removing spyware and preventing unauthorized access on endpoints

## Managed Virtual Server Services

**Provision Servers on Demand**

Managed Virtual Server Services deliver a leveraged virtual server offering to be leased on a per server instance basis and hosted from the Injazat Premier Data Center. Choose from small, medium or large servers depending on your application needs.

# Benefits

## Leverage a World-Class Data Center without Building One

Take advantage of our investment in our Premier Data Center without having to design, build and manage a facility yourself.

## The First Tier IV Certified Data Center in the Region

The Injazat Premier Data Center — with its stringent Tier IV Design Certification — offers state-of-the-art redundant systems, an integrated facility management infrastructure, and the very highest levels of security and operational reliability.

## Guaranteed Availability up to 99.995%

Injazat employs world-class best practices to provide reliable services for your business operations. The Data Center offers availability up to 99.995% per year. Our clients reach the highest operational reliability from the start, so they can deliver the levels of service that their businesses require.

## Absolute Security

Every layer of security, from physical to logical defense, gives you peace of mind and uninterrupted access to all of your business applications.

## Maintain Control

Enjoy control over your hardware and software without the inconvenience and headaches of constantly managing and maintaining a data center environment yourself.

## Shift Focus to Drive IT Innovation

Relieve your IT staff of the daily maintenance activities so they can focus on the core of your business and add more to your value proposition.

## Pay Only for your Actual Usage

With pay-per-use pricing, you can use our services as flexible offerings and eliminate the wasted cost of unused, excess capacity.

## Industry Standard Best Practices

Injazat uses processes based on ITIL®, follows ISO standards, and is registered with ANSI.
